

Secure Coding Tips

Hiding and Suppressing Issues Leaves Vulnerabilities Unaddressed

This week's Secure Coding Tip is about hiding and suppressing issues when performing scans using the HP Fortify Static Code Analyzer (SCA) software. Scanning source code to perform code review is an authorization requirement included in the Technical / Testing Requirements of the OCS Accreditation Requirements Guide / SOP [1] , and enforced as part of the ATO issuance process.[2]

One of the top 10 issues[3] encountered by VA application developers using the HP Fortify SCA software is hiding and suppressing issues reported during a Fortify scan.[4] Hiding and/or suppressing issues reported by Fortify is disallowed by the VA Secure Code Review Standard Operating Procedures (SOP)[5] to ensure all Fortify scan results are reported, audited, and mitigated according to SOP requirements.

There are several steps you can take to resolve the issue.
